CYBERSECURITY LAB REPORT

Password Auditing and Brute-Force Assessment Using THC-Hydra

Target: Metasploitable 2 (192.168.10.130)

Submitted by	Md. Jahid Matubber
Lab platform	Kali Linux / VMware Workstation
Assessment tool	THC-Hydra

Abstract

This report documents a controlled password-auditing exercise against a deliberately vulnerable Metasploitable 2 virtual machine. THC-Hydra was used to test authentication endpoints with a password wordlist and a small username/password combination file. The supplied screenshots show HTTP form-based login testing and additional authentication checks against services including SSH, FTP, PostgreSQL and VNC. Some Hydra runs report a valid credential result, while other service attempts show errors or no confirmed credential. The report distinguishes successful tool output from unsuccessful or inconclusive attempts and does not infer access beyond what the evidence shows.

1. Introduction

Password brute-force testing evaluates whether an authentication service accepts weak or commonly used passwords. In this lab, the testing was performed in a local virtual environment against Metasploitable 2, a purpose-built vulnerable training machine. The objective was to understand Hydra's authentication-testing workflow, observe service responses, and identify the security implications of weak credentials.

2. Lab Environment and Scope

Item	Evidence-based detail
Attacker machine	Kali Linux virtual machine
Target machine	Metasploitable 2
Target IP	192.168.10.130
Primary tool	THC-Hydra (version banner in screenshots: 9.7)
Wordlist	/usr/share/wordlists/rockyou.txt
Custom credential list	combo.txt (visible entries include admin/password, test/test123 and user/123456)
Testing scope	Authentication testing shown in the supplied screenshots

3. Objectives

- Run Hydra against an HTTP form-based authentication endpoint in the lab.
- Test a password wordlist and a prepared username/password combination file.
- Observe how Hydra reports valid credentials, failed attempts and service errors.
- Compare the outcomes across the additional services visible in the evidence.
- Document defensive measures for reducing password-guessing risk.

4. Methodology

4.1 HTTP form-based authentication test

The screenshots show Hydra configured with the target address 192.168.10.130 and an HTTP form authentication module. The request parameters include username and password placeholders, and the command references the application's form path and session/security cookie data. The rockyou.txt wordlist was used to submit candidate passwords for the selected account.

Hydra's output in the initial HTTP test includes a completion summary reporting one valid password found. The screenshots display an account/password result in the tool output. This is evidence of a credential accepted by the tested form under the configuration shown; it should not be generalized to other accounts or services.

4.2 Credential-pair testing

A small file named combo.txt was created and displayed in a terminal text editor. The visible entries are admin:password, test:test123 and user:123456. Hydra was then run using the combination file option against the same HTTP form. The screenshot shows the test completing and reporting one valid password found.

4.3 Additional service checks

Further screenshots show Hydra attempts directed at FTP, SSH, PostgreSQL and VNC-related services. These are documented as separate checks. The available screenshots include service-specific errors such as an unknown VNC server security result and a VNC server closing the connection. Those messages indicate that the attempt did not establish a verified successful login in the captured run. The evidence does not support claiming successful compromise of these services.

5. Results and Observations

Test area	**Observed result in screenshots**	**Assessment**
HTTP form + rockyou.txt	Hydra completion summary reports one valid password.	Credential acceptance reported by Hydra.
HTTP	Hydra compl	Credentia

for m + co mb o.tx t	etion summ ary report s one valid passw ord.	l acce ptan ce repo rted by Hydr a.
FTP	Hydra attem pts are visible; no clear succes sful creden tial is establi shed in the captur ed output .	Inco nclus ive / no succ ess confi rmed .
SSH	Attem pts are visible; captur ed output does not establi sh a succes sful login.	Inco nclus ive / no succ ess confi rmed .
Pos tgre SQL	Authe nticati on attem pts are shown ; no succes sful creden tial result is clearly eviden ced.	Inco nclus ive / no succ ess confi rmed .
VN	Outpu	Unsu

C	t report s server /securi ty negoti ation errors and conne ction closur e.	ccess ful in the capt ured run.

Interpretation: the strongest positive evidence in the supplied material relates to the HTTP form tests. The other service checks should be treated as attempted tests, not confirmed compromises. The screenshots do not provide a complete machine-wide account inventory or proof of post-login privilege level.

6. Security Risks

- Weak or reused passwords can be discovered through repeated authentication attempts.
- Publicly known/default credentials increase the likelihood of unauthorized access.
- Authentication endpoints without rate limiting or lockout controls may permit high-volume guessing.
- Verbose service responses can reveal implementation or negotiation details useful for troubleshooting attacks.

7. Recommendations

- Enforce long, unique passwords and block common or breached passwords.
- Apply multi-factor authentication (MFA) wherever supported.
- Use rate limiting, progressive delays and account lockout policies with careful safeguards against denial-of-service abuse.
- Monitor repeated failed logins and alert on distributed or high-frequency authentication attempts.
- Restrict management services such as SSH, FTP, database ports and VNC to trusted networks.
- Disable unused services and replace insecure or obsolete protocols with secure alternatives.
- Use approved password-auditing exercises periodically and document authorization and scope.

8. Limitations

This report is limited to the seven pages of screenshots supplied by the user. The screenshots do not include a complete exported terminal log, exact timestamps for every run, a full target service inventory, or independent

validation of every credential. Accordingly, only the HTTP Hydra success summaries are described as positive results. FTP, SSH, PostgreSQL and VNC outcomes are recorded as inconclusive or unsuccessful where the visible output does not confirm access.

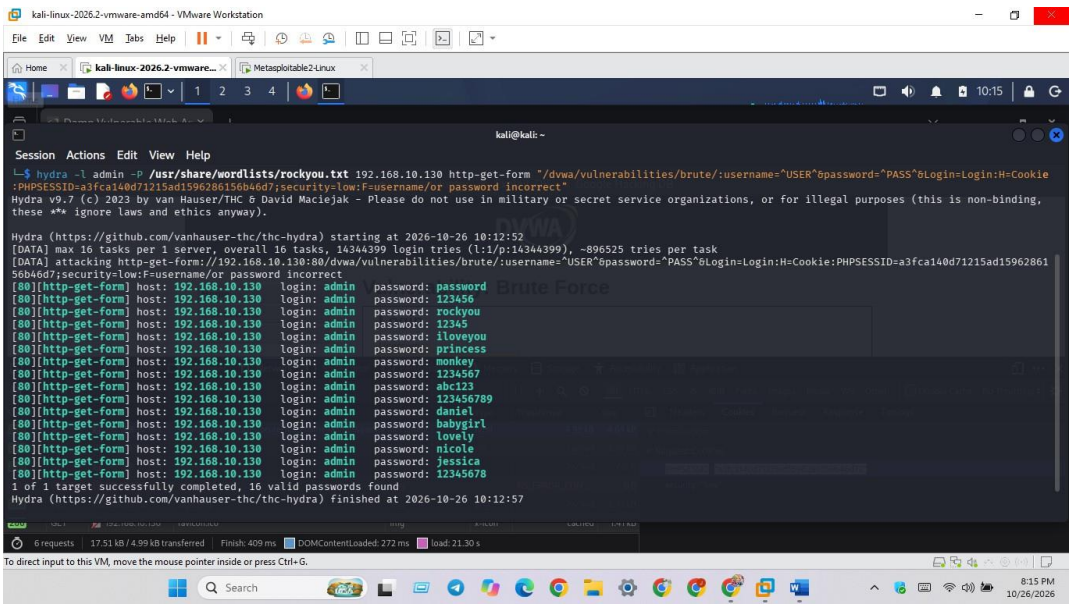

9. Conclusion

The lab demonstrates how THC-Hydra can be used to audit authentication strength in a controlled environment. The supplied evidence shows HTTP form-based testing with both a wordlist and a small credential-pair file, and Hydra reports one valid password in each of those captured runs. The additional service tests demonstrate that protocol negotiation and service-specific behavior can affect testing outcomes. The exercise reinforces the need for strong credentials, MFA, access restrictions, rate limiting and continuous authentication monitoring.

Appendix A. Original Screenshot Evidence

The following pages reproduce the seven pages of the supplied PDF in their original order. They are included as primary visual evidence for the commands and outputs summarized above.
