MALTEGO OSINT REPORT

Target: stillwearbd.com

Prepared: 29 October 2026

1. Executive Summary

This report provides a Maltego-style OSINT assessment framework for stillwearbd.com, based on the domain and asset information already observed during the user's reconnaissance workflow. No Maltego graph, transform output, or Maltego export was supplied in the available material. Consequently, this report does not claim that the listed entities were discovered or verified by Maltego itself. The entities below are candidate pivots for a Maltego graph and must be confirmed through actual transforms and source evidence.

The currently available context identifies the primary domain, a related IP address, several hostnames, and possible third-party service relationships. These are preliminary OSINT observations, not confirmed vulnerabilities.

2. Scope and Methodology

Primary entity	Domain: stillwearbd.com
Tool requested	Maltego (version not provided)
Assessment type	OSINT / entity relationship mapping
Available evidence	Previously shared theHarvester output, DNS observations, and SpiderFoot screenshots/log context
Maltego-specific evidence	Not supplied; no transform history, graph export, or Maltego findings available

3. Candidate Entities for a Maltego Graph

The following entities can be used as initial graph nodes, subject to validation in Maltego. Source column indicates where the item appeared in the prior material, not a Maltego transform result.

Entity / node	Relationship to investigate	Prior evidence / status
stillwearbd.com	Starting Domain entity	Target supplied by user
www.stillwearbd.com	Domain → hostname / DNS resolution	Visible in SpiderFoot graph and earlier discovery; validate
31.97.227.102	Domain/hostname → IP resolution	Previously observed in DNS/SpiderFoot context; verify current resolution
img.mail.stillwearbd.com	Subdomain → DNS / IP / certificate	theHarvester Hackertarget output
r.mail.stillwearbd.com	Subdomain → DNS / IP / certificate	theHarvester Hackertarget output
server.stillwearbd.com	Subdomain → CNAME / third-party service	Earlier DNS observation indicated track.pixelfly.io; revalidate
server2.stillwearbd.com	Subdomain → CNAME / third-party service	Earlier material indicated in.stape.io; revalidate
dns-parking.com	Nameserver/provider relationship	Visible in SpiderFoot graph; event type/source not confirmed
Hostinger-related entities	Hosting / DNS provider relationship	Visible in SpiderFoot graph; verify authoritative DNS/WHOIS evidence
Brevo-related mail tracking	Third-party email infrastructure relationship	Earlier DNS CNAME observations for mail-related subdomains; revalidate

4. Suggested Maltego Graph Workflow

1. Create a new graph and add a Domain entity for stillwearbd.com.

2. Run only the transforms available in your Maltego edition and appropriate to authorized OSINT, such as domain-to-DNS, domain-to-subdomain, domain-to-website, and domain-to-SSL-certificate transforms.
3. Add discovered hostnames and IP addresses as separate entities; run DNS resolution or certificate pivots where supported.
4. Inspect any third-party service relationships and record the exact transform, source, and timestamp. A shared provider or CNAME is not evidence of a vulnerability.
5. Remove duplicate entities and preserve relationship edges only where Maltego output or source evidence supports them.
6. Export the actual graph or findings to CSV/PDF and update this report with verified nodes, edge relationships, source details, and counts.

5. Preliminary Assessment

Area	Current assessment	Confidence
Asset discovery	Several domain-related candidate entities are known from prior reconnaissance	Preliminary
Third-party relationships	Possible email/tracking/hosting relationships were observed in earlier material	Requires validation
Security vulnerabilities	No Maltego-confirmed or otherwise confirmed vulnerability is established	Insufficient evidence
Coverage	No Maltego transform log or graph export supplied	Incomplete

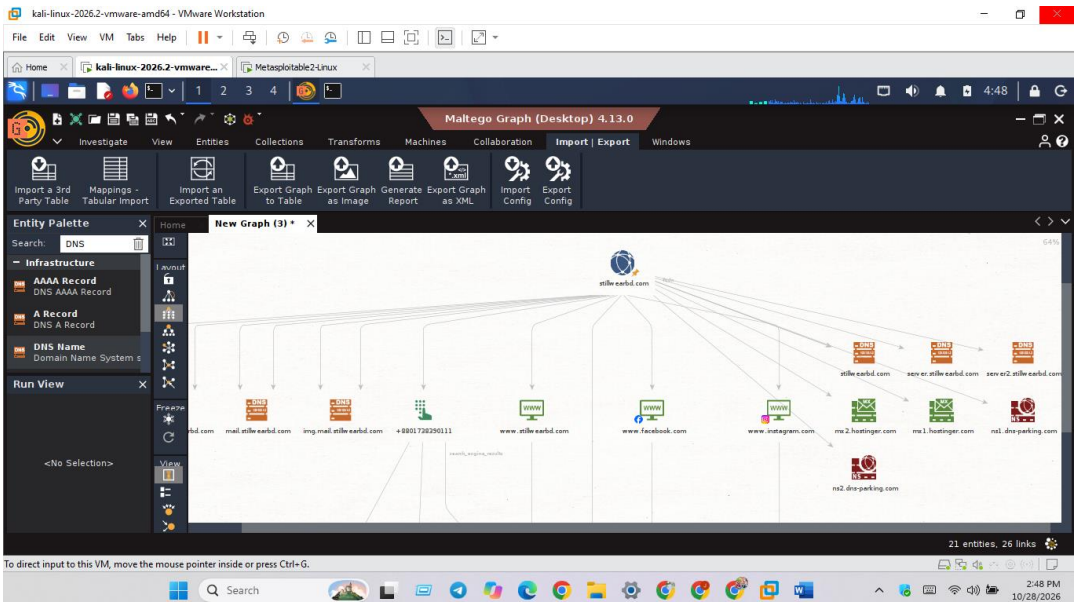

6. Limitations

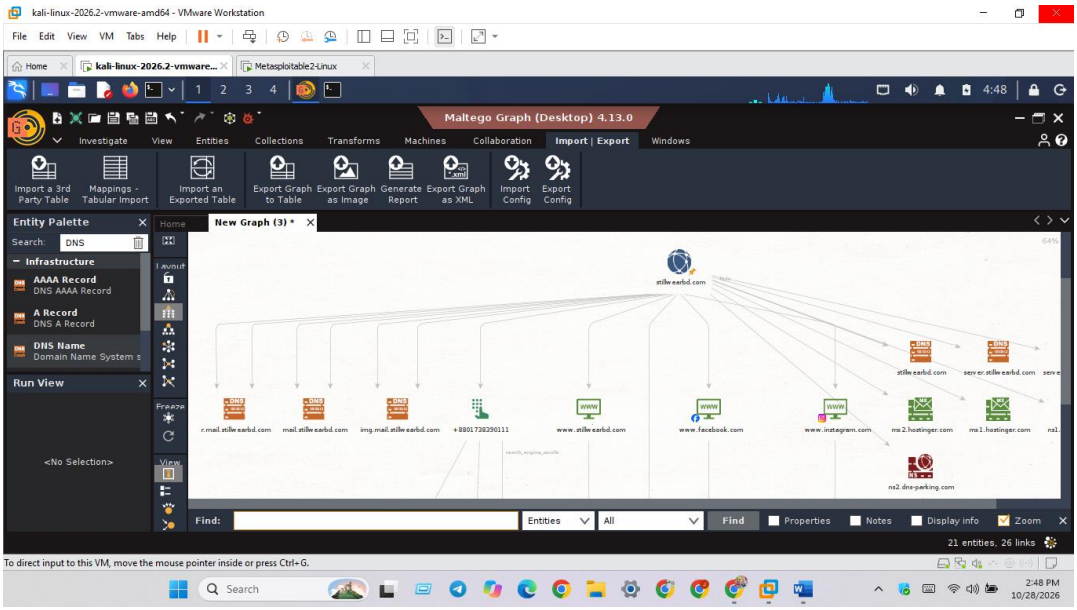

- No Maltego screenshot, graph file, transform output, or export was provided.
- Maltego version and selected transforms are unknown.
- Candidate entities are carried forward from previous theHarvester, DNS, and SpiderFoot context; they must not be attributed to Maltego until confirmed in its output.
- DNS and third-party service relationships may change over time and should be rechecked.
- Asset discovery alone does not prove a vulnerability or security impact.

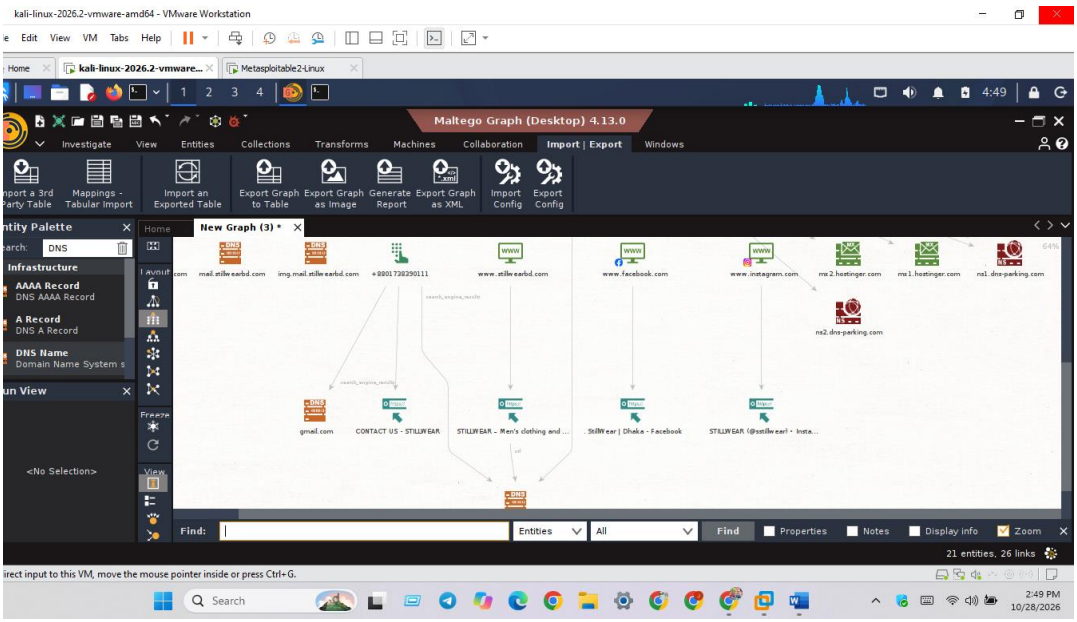

7. Conclusion

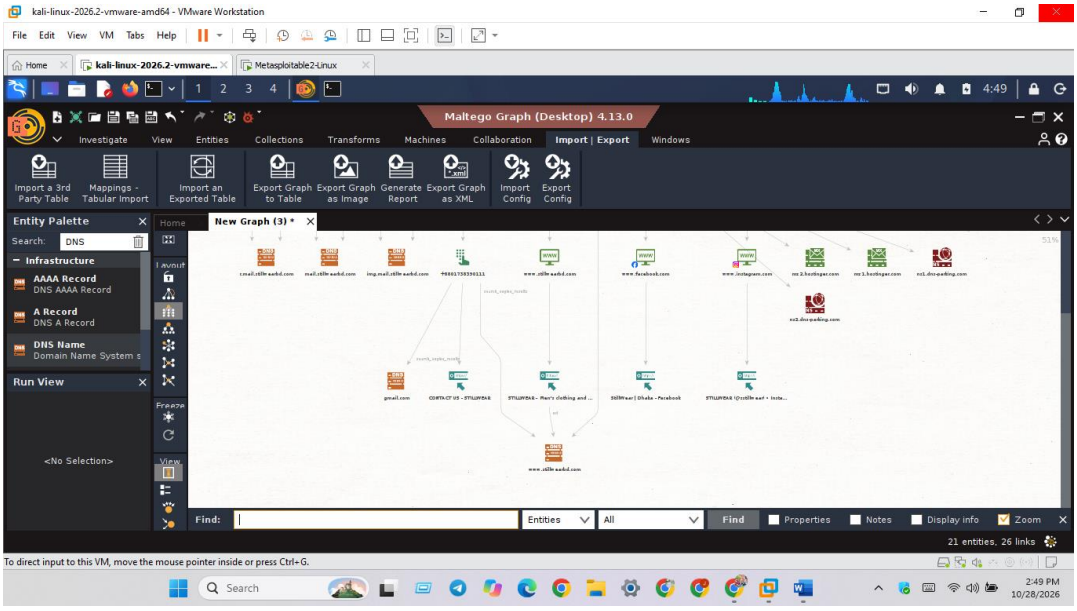

Maltego can be used to map relationships among the target domain, hostnames, IP addresses, DNS records, certificates, and third-party services. Based on the currently available evidence, this document is a preliminary Maltego investigation plan and candidate-entity report, not a final report of completed Maltego transforms. A true final report requires the actual Maltego graph or exported results so that findings can be attributed correctly and independently verified.
